

## OCEAN COUNTY MATHEMATICS CURRICULUM

**Content Area:** Mathematics

**Course Title:** Calculus I

**Grade Level:**  
High School

**Pre-Requisite Skills**

**20 Days**

**Overview of Calculus**

**5 Days**

**Limits and Continuity**

**10 Days**

**The Derivative**

**30 Days**

**Applications of the Derivative**

**25 Days**

**Higher Order of Derivatives and  
Graphing Implications**

**15 Days**

**Anti-Derivatives and The Definite  
Integral**

**26 Days**

**Differential Equations**

**22 Days**

**Applications of Integration**

**24 Days**

**Date Created:**

**February 9, 2012**

# OCEAN COUNTY MATHEMATICS CURRICULUM

## Unit Overview

**Content Area:** Mathematics

**Grade:** High School

**Unit Title:** Pre-Requisite Skills

**Domain:** High School: Algebra, Functions, Modeling, & Geometry

### Unit Summary:

This unit will review pre-requisite skills necessary for success in calculus. The skills include solving equations and inequalities, graphing functions and relations, simplifying, graphing, adding, subtracting and multiplying rational expressions; understanding and using function notation; evaluating and simplifying trigonometric expressions; solving and graphing trig equations.

### Primary interdisciplinary connections:

Infused within the unit are connections to the 2009 NJCCCS for Language Arts Literacy and Business, Science and Technology. Critical reading, writing, and mathematical modeling skills are promoted within the problem solving process and as a means to explain solutions.

### 21<sup>st</sup> century themes:

The unit will integrate the 21<sup>st</sup> Century Life and career standard 9.1 strands A-D. These strands include: critical thinking and problem solving, creativity and innovation, collaboration, teamwork, and leadership, and cross cultural understanding and interpersonal communication.

## Learning Targets

### Content Standards

Number	Common Core Standard for Mastery
A-APR.6	Rewrite simple rational expressions in different forms; write $a(x)/b(x)$ in the form $q(x) + r(x)/b(x)$ , where $a(x)$ , $b(x)$ , $q(x)$ , and $r(x)$ are polynomials with the degree of $r(x)$ less than the degree of $b(x)$ , using inspection, long division, or, for the more complicated examples, a computer algebra system.
A-CED.1	Create equations and inequalities in one variable and use them to solve problems. Include equations arising from linear and quadratic functions, and simple rational and exponential functions.
A-CED.2	Create equations in two or more variables to represent relationships between quantities; graph equations on coordinate axes with labels and scales.
A-REI.2	Solve simple rational and radical equations in one variable, and give examples showing how extraneous solutions may arise.
A-REI.3	Solve linear equations and inequalities in one variable, including equations with coefficients represented by letters.
A-REI.4	Solve quadratic equations in one variable.
A-REI.10	Understand that the graph of an equation in two variables is the set of all its solutions plotted in the coordinate plane, often forming a curve (which could be a line).

F-IF.1	Understand that a function from one set (called the domain) to another set (called the range) assigns to each element of the domain exactly one element of the range. If $f$ is a function and $x$ is an element of its domain, then $f(x)$ denotes the output of $f$ corresponding to the input $x$ . The graph of $f$ is the graph of the equation $y = f(x)$ .
F-IF.2	Use function notation, evaluate functions for inputs in their domains, and interpret statements that use function notation in terms of a context.
F-IF.4	For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity.
F-IF.5	Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes. For example, if the function $h(n)$ gives the number of person-hours it takes to assemble $n$ engines in a factory, then the positive integers would be an appropriate domain for the function.
F-IF.6	Calculate and interpret the average rate of change of a function (presented symbolically or as a table) over a specified interval. Estimate the rate of change from a graph.
F-IF.7	Graph functions expressed symbolically and show key features of the graph, by hand in simple cases and using technology for more complicated cases.
F-IF.8	Write a function defined by an expression in different but equivalent forms to reveal and explain different properties of the function.
F-IF.9	Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions). For example, given a graph of one quadratic function and an algebraic expression for another, say which has the larger maximum.
F-BF.1	Write a function that describes a relationship between two quantities.
F-BF.2	Write arithmetic and geometric sequences both recursively and with an explicit formula, use them to model situations, and translate between the two forms.
F-BF.3	Identify the effect on the graph of replacing $f(x)$ by $f(x) + k$ , $k f(x)$ , $f(kx)$ , and $f(x + k)$ for specific values of $k$ (both positive and negative); find the value of $k$ given the graphs. Experiment with cases and illustrate an explanation of the effects on the graph using technology. Include recognizing even and odd functions from their graphs and algebraic expressions for them.
F-BF.4	Find inverse functions.
F-BF.5	Understand the inverse relationship between exponents and logarithms and use this relationship to solve problems involving logarithms and exponents.
F-LE.5	Interpret the parameters in a linear or exponential function in terms of a context.
F-TF.5	Choose trigonometric functions to model periodic phenomena with specified amplitude, frequency, and midline.

F-TF.7	Use inverse functions to solve trigonometric equations that arise in modeling contexts; evaluate the solutions using technology, and interpret them in terms of the context.
G-MG.1.	Use geometric shapes, their measures, and their properties to describe objects.
G-MG.3.	Apply geometric methods to solve design problems.
<b>Unit Essential Questions</b> <ul style="list-style-type: none"> <li>• Are the necessary pre-requisite skills in place for success in calculus?</li> </ul>	<b>Unit Enduring Understandings</b> <i>Students will understand that...</i> <ul style="list-style-type: none"> <li>• There are certain skills from previous math courses that are essential to success in Calculus.</li> </ul>

**OCEAN COUNTY MATHEMATICS CURRICULUM**  
**Evidence of Learning**

**Formative Assessments**

- Think/Pair/Share Problem Review
- Guided Practice with Scaffolds as needed
- Short verbal quiz using leading questions
- Qualitative assessment
- Fluency testing
- Technology integration

**Summative Assessments**

- Chapter Testing – w/ and w/o technology
- Chapter Projects

**Modifications (ELLs, Special Education, Gifted and Talented)**

- Technology resources
- Teacher Tutoring
- Peer Tutoring
- Cooperative Learning Groups
- Modified Assignments
- Differentiated Instruction
- Native Language texts and native language to English dictionary
- Follow all IEP modifications/504 plan

**Curriculum development Resources/Instructional Materials/Equipment Needed Teacher Resources:**

- Graphing Calculator
- Whiteboards
- Classroom projector
- Web access for supplemental materials
- Text Book

**Teacher Notes:**

## OCEAN COUNTY MATHEMATICS CURRICULUM

### Unit Overview

**Content Area: Mathematics**

**Grade: High School**

**Unit Title:** Overview of Calculus

**Domain:** Number & Quantity/Algebra/Functions/Modeling/Geometry

**Unit Summary:**

The students will be introduced to the main concepts in Calculus. The unit is based on the Paul Forrester Calculus: Concepts and Applications textbook from Key Curriculum Press. The students get a brief overview of the concepts of limits, instantaneous rate of change and area under a curve via rectangles and trapezoids.

**Primary interdisciplinary connections:**

Infused within the unit are connections to the 2009 NJCCCS for Language Arts Literacy and Business, Science and Technology. Critical reading, writing, and mathematical modeling skills are promoted within the problem solving process and as a means to explain solutions.

**21<sup>st</sup> century themes:**

The unit will integrate the 21<sup>st</sup> Century Life and career standard 9.1 strands A-D. These strands include: critical thinking and problem solving, creativity and innovation, collaboration, teamwork, and leadership, and cross cultural understanding and interpersonal communication.

### Learning Targets

**Content Standards**

Number	Common Core Standard for Mastery
N-RN.1	Explain how the definition of the meaning of rational exponents follows from extending the properties of integer exponents to those values, allowing for a notation for radicals in terms of rational exponents.
N-Q.1	Use units as a way to understand problems and to guide the solution of multi-step problems; choose and interpret units consistently in formulas; choose and interpret the scale and the origin in graphs and data displays.
N-Q.2	Define appropriate quantities for the purpose of descriptive modeling.
N-Q.3	Choose a level of accuracy appropriate to limitations on measurement when reporting quantities.
A-CED.1	Create equations and inequalities in one variable and use them to solve problems. <i>Include equations arising from linear and quadratic functions, and simple rational and exponential functions.</i>
A-CED.3	Represent constraints by equations or inequalities, and by systems of equations and/or inequalities, and interpret solutions as viable or nonviable options in a modeling context.
Number	Common Core Standard for Mastery

A-REI.11	Explain why the $x$ -coordinates of the points where the graphs of the equations $y = f(x)$ and $y = g(x)$ intersect are the solutions of the equation $f(x) = g(x)$ ; find the solutions approximately, e.g., using technology to graph the functions, make tables of values, or find successive approximations. Include cases where $f(x)$ and/or $g(x)$ are linear, polynomial, rational, absolute value, exponential, and logarithmic functions. ★
F-IF.4	For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. <i>Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity.</i>
F-IF.5	Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes. <i>For example, if the function <math>h(n)</math> gives the number of person-hours it takes to assemble <math>n</math> engines in a factory, then the positive integers would be an appropriate domain for the function.</i>
F-IF.6	Calculate and interpret the average rate of change of a function (presented symbolically or as a table) over a specified interval. Estimate the rate of change from a graph.
F-BF.1	Write a function that describes a relationship between two quantities.
F-LE.1	Distinguish between situations that can be modeled with linear functions and with exponential functions.
F-LE.4	For exponential models, express as a logarithm the solution to $ab^ct = d$ where $a$ , $c$ , and $d$ are numbers and the base $b$ is 2, 10, or $e$ ; evaluate the logarithm using technology.
FL-E.5	Interpret the parameters in a linear or exponential function in terms of a context.
G-MG.3	Apply geometric methods to solve design problems (e.g., designing an object or structure to satisfy physical constraints or minimize cost; working with typographic grid systems based on ratios). ★
<b>Unit Essential Questions</b>	<b>Unit Enduring Understandings</b>
<ul style="list-style-type: none"> <li>● How much has a quantity changed?</li> <li>● How quickly does a quantity change?</li> </ul>	<i>Students will understand that...</i> <ul style="list-style-type: none"> <li>● A function can be interpreted graphically, analytically and numerically.</li> <li>● The rate of change of any function can be found at a particular instant.</li> <li>● The amount that a function has changed over a given time can be interpreted from a graph.</li> </ul>
<b>Unit Objectives</b>	<b>Unit Objectives</b>
<i>Students will know...</i> <ul style="list-style-type: none"> <li>● The limit of a function at a point happens as the values of <math>x</math> get close to but not necessarily equal to <math>x</math>.</li> </ul>	<i>Students will be able to...</i> <ul style="list-style-type: none"> <li>● Evaluate a limit</li> <li>● Determine the instantaneous rate of change of a function</li> </ul>

- The derivative of a function represents the instantaneous rate of change.
- The area under a curve is the amount of change of a function over time.

- Use rectangles and trapezoids to approximate area under a curve.

**OCEAN COUNTY MATHEMATICS CURRICULUM**  
**Unit Overview**

**Content Area: Mathematics**

**Grade: High School**

<b>Domain:</b> Number & Quantity/Algebra/Functions/ Modeling, Geometry	
<b>Unit:</b> Limits	
<b>Unit Summary</b> Students to connect PreCalculus to Calculus through the limit process. Geometrical, numerical, and algebraic methods will be explored. Topics include: Continuous - discontinuous functions and the effect on finding limits (continuity), the definition of limit, the explanation of why limits fail, limit properties and how they make finding limits easier, the squeeze theorem and finding limits of trigonometric functions, IVT, EVT, Continuity and one sided limits, limits at infinity, and the epsilon delta definition of limits.	
<b>Primary interdisciplinary connections:</b> Infused within the unit are connections to the 2009 NJCCCS for Language Arts Literacy and Business, Science and Technology. Critical reading, writing, and mathematical modeling skills are promoted within the problem solving process and as a means to explain solutions.	
<b>21<sup>st</sup> century themes:</b> The unit will integrate the 21 <sup>st</sup> Century Life and career standard 9.1 strands A-D. These strands include: critical thinking and problem solving, creativity and innovation, collaboration, teamwork, and leadership, and cross cultural understanding and interpersonal communication.	
<b>Learning Targets</b>	
<b>Content Standards</b>	
<b>Number</b>	<b>Common Core Standard for Mastery</b>
N-Q.3	Choose a level of accuracy appropriate to limitations on measurement when reporting quantities
A-SSE.3	Choose and produce an equivalent form of an expression to reveal and explain properties of the quantity represented by the expression
A-APR.6	Rewrite simple rational expressions in different forms; write $a(x)/b(x)$ in the form $q(x) + r(x)/b(x)$ , where $a(x)$ , $b(x)$ , $q(x)$ , and $r(x)$ are polynomials with the degree of $r(x)$ less than the degree of $b(x)$ , using inspection, long division, or, for the more complicated examples, a computer algebra system.
F-IF.4	For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship.
F-IF.7	Graph functions expressed symbolically and show key features of the graph, by hand in simple cases and using technology for more complicated cases

<b>Unit:</b> The Derivative		
<b>Domain:</b> Number & Quantity/Algebra/Functions/Modeling/Geometry		
<p><b>Unit Summary</b></p> <p>The derivative is a mathematical breakthrough from the 17<sup>th</sup> century. It helps to answer the question as to “how fast” certain quantities are changing. The derivative gives the slope of the tangent line to a function which measures the instantaneous rate of the function at a given point. The derivative can be calculated graphically, analytically or numerically.</p> <p><b>Primary interdisciplinary connections:</b></p> <p>Infused within the unit are connections to the 2009 NJCCCS for Language Arts Literacy and Business, Science and Technology. Critical reading, writing, and mathematical modeling skills are promoted within the problem solving process and as a means to explain solutions.</p> <p><b>21<sup>st</sup> century themes:</b></p> <p>The unit will integrate the 21<sup>st</sup> Century Life and career standard 9.1 strands A-D. These strands include: critical thinking and problem solving, creativity and innovation, collaboration, teamwork, and leadership, and cross cultural understanding and interpersonal communication.</p>		
<b>Learning Targets</b>		
<b>Content Standards</b>		
<b>Number</b>	<b>Common Core Standard for Mastery</b>	
N-RN.2	Explain how the definition of the meaning of rational exponents follows from extending the properties of integer exponents to those values, allowing for a notation for radicals in terms of rational exponents.	
N-Q.1	Use units as a way to understand problems and to guide the solution of multi-step problems; choose and interpret units consistently in formulas; choose and interpret the scale and the origin in graphs and data displays.	
N-Q.2	Define appropriate quantities for the purpose of descriptive modeling.	
N-Q.3	Choose a level of accuracy appropriate to limitations on measurement when reporting quantities.	
A-SSE.1	Interpret expressions that represent a quantity in terms of its context.	
A-SSE.3	Choose and produce an equivalent form of an expression to reveal and explain properties of the quantity represented by the expression.	
A-CED.1	Create equations and inequalities in one variable and use them to solve problems. Include equations arising from linear and quadratic	

	functions, and simple rational and exponential functions.
A-CED.4	Rearrange formulas to highlight a quantity of interest, using the same reasoning as in solving equations. For example, rearrange Ohm's law $V = IR$ to highlight resistance $R$ .
F-IF.4	For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship.
F-IF.5	Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes.
F-IF.6	Calculate and interpret the average rate of change of a function (presented symbolically or as a table) over a specified interval. Estimate the rate of change from a graph.
F-BF.1	Write a function that describes a relationship between two quantities.

**OCEAN COUNTY MATHEMATICS CURRICULUM**  
**Unit Overview**

**Content Area:** Mathematics **Grade:** High School

**Unit Title:** Higher Order of Derivatives and Graphing Implications

**Domain:** Number & Quantity/Algebra/Functions/Modeling/Geometry

**Unit Summary:**

This unit shows how to draw conclusions from derivatives about the extreme values of a function and about the general shape of a function’s graph. It further investigates how a tangent line captures the shape of a curve near the point of tangency, how to deduce rates of change that cannot be measured from rates of change that are already known, and how to find a function when only its first derivative and its value at a single point are known.

**Primary interdisciplinary connections:**

Infused within the unit are connections to the 2009 NJCCCS for Language Arts Literacy and Business, Science and Technology. Critical reading, writing, and mathematical modeling skills are promoted within the problem solving process and as a means to explain solutions.

**21<sup>st</sup> century themes:**

The unit will integrate the 21<sup>st</sup> Century Life and career standard 9.1 strands A-D. These strands include: critical thinking and problem solving, creativity and innovation, collaboration, teamwork, and leadership, and cross cultural understanding and interpersonal communication.

**Learning Targets**

**Content Standards**

Number	Common Core Standard for Mastery
F-IF 2.	Use function notation, evaluate functions for inputs in their domains, and interpret statements that use function notation in terms of a context.
F-IF 3.	Recognize that sequences are functions, sometimes defined recursively, whose domain is a subset of the integers. <i>For example, the Fibonacci sequence is defined recursively by <math>f(0) = f(1) = 1, f(n+1) = f(n) + f(n-1)</math> for <math>n \geq 1</math>.</i>
F-IF 4.	For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. <i>Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity.</i> ★

F-IF 5.	Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes. <i>For example, if the function <math>h(n)</math> gives the number of person-hours it takes to assemble <math>n</math> engines in a factory, then the positive integers would be an appropriate domain for the function.</i> ★
F-IF 6.	Calculate and interpret the average rate of change of a function (presented symbolically or as a table) over a specified interval. Estimate the rate of change from a graph.★
F-IF 8.	Write a function defined by an expression in different but equivalent forms to reveal and explain different properties of the function. a. Use the process of factoring and completing the square in a quadratic function to show zeros, extreme values, and symmetry of the graph, and interpret these in terms of a context. b. Use the properties of exponents to interpret expressions for exponential functions. <i>For example, identify percent rate of change in functions such as <math>y = (1.02)^t</math>, <math>y = (0.97)^t</math>, <math>y = (1.01)12t</math>, <math>y = (1.2)t/10</math>, and classify them as representing exponential growth or decay.</i>
F-IF 9.	Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions). <i>For example, given a graph of one quadratic function and an algebraic expression for another, say which has the larger maximum.</i>
<p><b>Unit Essential Questions</b></p> <ul style="list-style-type: none"> <li>• What is the importance of maximum and minimum values in real world situations?</li> <li>• What is the relationship between function values and rates of change?</li> <li>• What is the relationship between a function's rate of change and its optimum value?</li> <li>• When do critical numbers yield local extrema? Similarly, when do hypercritical numbers yield inflection points?</li> </ul>	<p><b>Unit Enduring Understandings</b></p> <p><i>Students will understand that...</i></p> <ul style="list-style-type: none"> <li>• There exists a relationship between a function's maxima and the rate of change at those points, as applied to real world situations.</li> </ul>
<p><b>Unit Objectives</b></p> <p><i>Students will know...</i></p> <ul style="list-style-type: none"> <li>• The Mean value Theorem guarantees that functions increase/decrease depending on the value of the derivative.</li> <li>• The first and second derivatives indicate the behavior of the original function.</li> </ul>	<p><b>Unit Objectives</b></p> <p><i>Students will be able to...</i></p> <ul style="list-style-type: none"> <li>• Use the Mean Value Theorem to determine the point at which the derivative equals the average rate of change.</li> <li>• Use the first and second derivative tests to determine maxima, points of inflection, intervals of increase/decrease, and intervals of concavity.</li> </ul>

<b>Content Area:</b> Mathematics		<b>Grade:</b> High School
<b>Unit Title:</b> Anti-Derivatives and the Definite Integral		
<b>Domain:</b> Number & Quantity/Algebra/Functions/Modeling/Geometry		
<p><b>Unit Summary:</b></p> <p>The students will evaluate the anti-derivative of a function in general terms and with initial conditions. The students will learn and apply the Fundamental Theorem of Calculus. The students will understand the inverse relationship between a derivative and anti-derivative.</p> <p><b>Primary interdisciplinary connections:</b></p> <p>Infused within the unit are connections to the 2009 NJCCCS for Language Arts Literacy and Business, Science and Technology. Critical reading, writing, and mathematical modeling skills are promoted within the problem solving process and as a means to explain solutions.</p> <p><b>21<sup>st</sup> century themes:</b></p> <p>The unit will integrate the 21<sup>st</sup> Century Life and career standard 9.1 strands A-D. These strands include: critical thinking and problem solving, creativity and innovation, collaboration, teamwork, and leadership, and cross cultural understanding and interpersonal communication.</p>		
<b>Learning Targets</b>		
<b>Content Standards</b>		
<b>Number</b>	<b>Common Core Standard for Mastery</b>	
N-Q.1	Use units as a way to understand problems and to guide the solution of multi-step problems; choose and interpret units consistently in formulas; choose and interpret the scale and the origin in graphs and data displays.	
N-Q.2	Define appropriate quantities for the purpose of descriptive modeling.	
N-Q.3	Choose a level of accuracy appropriate to limitations on measurement when reporting quantities.	
A-CED.1	Create equations and inequalities in one variable and use them to solve problems. <i>Include equations arising from linear and quadratic functions, and simple rational and exponential functions.</i>	
A-CED.3	Represent constraints by equations or inequalities, and by systems of equations and/or inequalities, and interpret solutions as viable or nonviable options in a modeling context.	
A-REI.11	Explain why the $x$ -coordinates of the points where the graphs of the equations $y = f(x)$ and $y = g(x)$ intersect are the solutions of the equation $f(x) = g(x)$ ; find the solutions approximately, e.g., using technology to graph the functions, make tables of values, or find successive approximations. Include cases where $f(x)$ and/or $g(x)$ are linear, polynomial, rational, absolute value, exponential, and logarithmic functions.	
F-IF.4	For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. <i>Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or</i>	

	<i>negative; relative maximums and minimums; symmetries; end behavior; and periodicity.</i>
F-IF.5	Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes. <i>For example, if the function <math>h(n)</math> gives the number of person-hours it takes to assemble <math>n</math> engines in a factory, then the positive integers would be an appropriate domain for the function.</i>
F-IF.6	Calculate and interpret the average rate of change of a function (presented symbolically or as a table) over a specified interval. Estimate the rate of change from a graph.
F-IF.8	Write a function defined by an expression in different but equivalent forms to reveal and explain different properties of the function.
F-BF.1	Write a function that describes a relationship between two quantities.
F-LE.1	Distinguish between situations that can be modeled with linear functions and with exponential functions.
F-LE.4	For exponential models, express as a logarithm the solution to $abct = d$ where $a$ , $c$ , and $d$ are numbers and the base $b$ is 2, 10, or $e$ ; evaluate the logarithm using technology.
F-LE.5	Interpret the parameters in a linear or exponential function in terms of a context.
G-MG.1	Use geometric shapes, their measures, and their properties to describe objects
G-MG.3	Apply geometric methods to solve design problems (e.g., designing an object or structure to satisfy physical constraints or minimize cost; working with typographic grid systems based on ratios).
<b>Unit Essential Questions</b>	<b>Unit Enduring Understandings</b>
<ul style="list-style-type: none"> <li>• How much has a quantity changed?</li> <li>• What is the relationship between a derivative and an integral?</li> <li>• What is the relationship between area under a curve and an integral?</li> </ul>	<p><i>Students will understand that...</i></p> <ul style="list-style-type: none"> <li>• A function can be interpreted graphically, analytically and numerically.</li> <li>• The amount that a function has changed over a given time can be interpreted from a graph.</li> <li>• The connection between the definite integral and the area under a curve.</li> </ul>

## OCEAN COUNTY MATHEMATICS CURRICULUM

### Unit Overview

**Content Area:** Mathematics

**Grade:** High School

**Unit Title:** Differential Equations

**Domain:** Number & Quantity/Algebra/Functions/Modeling/Geometry

**Unit Summary:**

The students will solve differential equations using separation of variables. Students will solve differential equations involving exponential growth and decay. Students use various pre-requisite skills and techniques to solve differential equations.

**Primary interdisciplinary connections:**

Infused within the unit are connections to the 2009 NJCCCS for Language Arts Literacy and Business, Science and Technology. Critical reading, writing, and mathematical modeling skills are promoted within the problem solving process and as a means to explain solutions.

**21<sup>st</sup> century themes:**

The unit will integrate the 21<sup>st</sup> Century Life and career standard 9.1 strands A-D. These strands include: critical thinking and problem solving, creativity and innovation, collaboration, teamwork, and leadership, and cross cultural understanding and interpersonal communication.

### Learning Targets

**Content Standards**

Number	Common Core Standard for Mastery
N-RN.1	Explain how the definition of the meaning of rational exponents follows from extending the properties of integer exponents to those values, allowing for a notation for radicals in terms of rational exponents.
N-Q.1	Use units as a way to understand problems and to guide the solution of multi-step problems; choose and interpret units consistently in formulas; choose and interpret the scale and the origin in graphs and data displays.
N-Q.2	Define appropriate quantities for the purpose of descriptive modeling.
N-Q.3	Choose a level of accuracy appropriate to limitations on measurement when reporting quantities.
A-CED.1	Create equations and inequalities in one variable and use them to solve problems. <i>Include equations arising from linear and quadratic functions, and simple rational and exponential functions.</i>
A-CED.3	Represent constraints by equations or inequalities, and by systems of equations and/or inequalities, and interpret solutions as viable or nonviable options in a modeling context.
A-REI.11	Explain why the $x$ -coordinates of the points where the graphs of the equations $y = f(x)$ and $y = g(x)$ intersect are the solutions of the equation $f(x) = g(x)$ ; find the solutions approximately, e.g., using technology to graph the functions, make tables of values, or find successive approximations. Include cases where $f(x)$ and/or $g(x)$ are linear, polynomial, rational, absolute value, exponential, and logarithmic functions. ★

F-IF.4	For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. <i>Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity.</i>
F-IF.5	Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes. <i>For example, if the function <math>h(n)</math> gives the number of person-hours it takes to assemble <math>n</math> engines in a factory, then the positive integers would be an appropriate domain for the function.</i>
F-IF.6	Calculate and interpret the average rate of change of a function (presented symbolically or as a table) over a specified interval. Estimate the rate of change from a graph.
F-BF.1	Write a function that describes a relationship between two quantities.
F-LE.1	Distinguish between situations that can be modeled with linear functions and with exponential functions.
F-LE.4	For exponential models, express as a logarithm the solution to $ab^ct = d$ where $a$ , $c$ , and $d$ are numbers and the base $b$ is 2, 10, or $e$ ; evaluate the logarithm using technology.
FL-E.5	Interpret the parameters in a linear or exponential function in terms of a context.
G-MG.3	Apply geometric methods to solve design problems (e.g., designing an object or structure to satisfy physical constraints or minimize cost; working with typographic grid systems based on ratios). <sup>★</sup>

<p><b>Unit Essential Questions</b></p> <ul style="list-style-type: none"> <li>● How much has a quantity changed?</li> <li>● What does a slope field represent?</li> <li>● What techniques of integration can be used to solve a differential equation?</li> </ul>	<p><b>Unit Enduring Understandings</b></p> <p><i>Students will understand that...</i></p> <ul style="list-style-type: none"> <li>● Exponential quantities change in a proportional matter.</li> <li>● Differential equations have always been a prime motivation for the study of calculus and remain so to this day</li> <li>● Anti-differentiation techniques are essential for applying the results of calculus</li> </ul>

**Unit Objectives**

*Students will know...*

- How to find displacement and/or total distance from a given velocity.
- How to find boundaries for integrating between intersecting curves.
- When to use horizontal or vertical rectangles for finding area based upon given conditions.
- Compute the areas and volumes manually and through the use of available technology.

**Unit Objectives**

*Students will be able to...*

- Find displacement an object at a given moment.
- Find the total distance traveled over an given interval of time.
- Use algebraic methods or available technology to find point(s) of intersection that will be the boundaries of bounded regions.
- Use algebraic methods or available technology to find areas and volumes.
- Use dimensional analysis to determine what quantities and units of measure are calculated. *For example – the calculated area under velocity curve (ft/sec) for a given time interval (in sec.) would result in how far (ft.) the object travels.*
